INTERACTIVE LEARNING

5 Ways Interactive Content Beats Video for Learning

After shipping 100+ applets, here's what I've seen work.

01

Active Recall vs Passive Watching

Videos let learners sit back. Interactive applets force them to manipulate, predict, and test. The brain encodes information 3x better when hands are involved.

> Watching a fractions video ≠ dragging fraction bars to discover equivalence yourself.

02

Instant Feedback Loops

In a video, you wait until the quiz at the end to know if you understood. In an interactive applet, every action gives immediate visual feedback.

Move a slider → see the graph change → understand the concept. No waiting.

03

Self-Paced Exploration

Videos run at one speed for everyone. Interactive content lets fast learners skip ahead and struggling learners spend more time on what they need.

> Same applet, different learning paths. That's real personalization.

04

Retention That Lasts

- Lecture retention after 24 hours: ~10%
- Video retention after 24 hours: ~20%
- Interactive practice retention: ~75%
- The difference? Doing vs watching.

05

Measurable Learning Signals

Videos give you "watched 80%" as a metric. Interactive content gives you manipulation patterns, time-per-concept, error sequences, and misconception maps.

> You can't improve what you can't measure. Interactivity gives you the data.

Building EdTech? Let's talk interactive.

I help companies ship interactive learning products in 3-4 weeks, not months.
