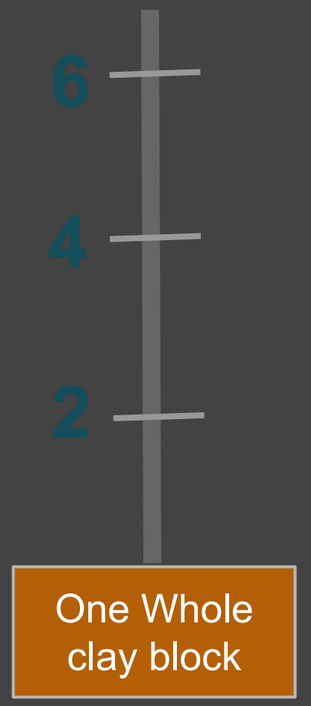
Let’s explore how the same value can be shown using different fractions.

Pulsate the blocks one by one and also pulsate one whole block right side

After 2 seconds highlight the slider and add slicer

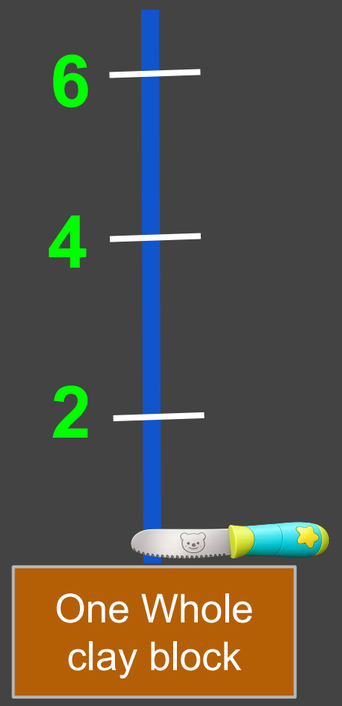
Divide the block into equal parts



Watch how a whole can be divided into equal parts.

Pulsate first block and after 2 seconds dehighlight 2nd and 3rd block and should appear like next slide

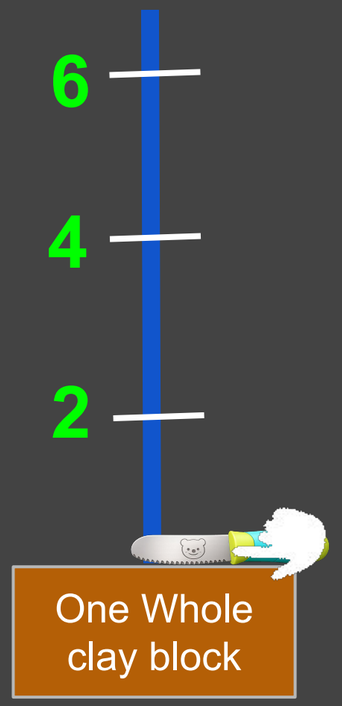
Divide the block into equal parts



Divide the whole into 2 equal parts.

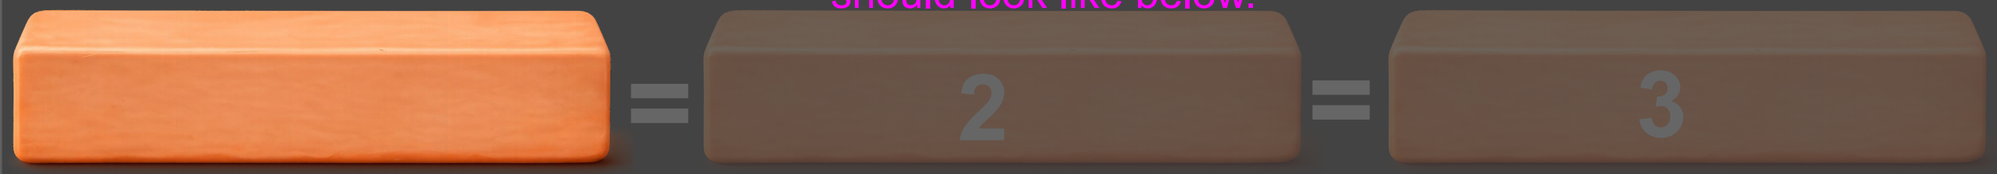
If the user move the knife other than 2, block can be divided into that many parts and then teeter the block, move back the knife to original position, when place the knife in the correct number, just lock the knife at that number showing green highlight around the block.

Divide the block into equal parts

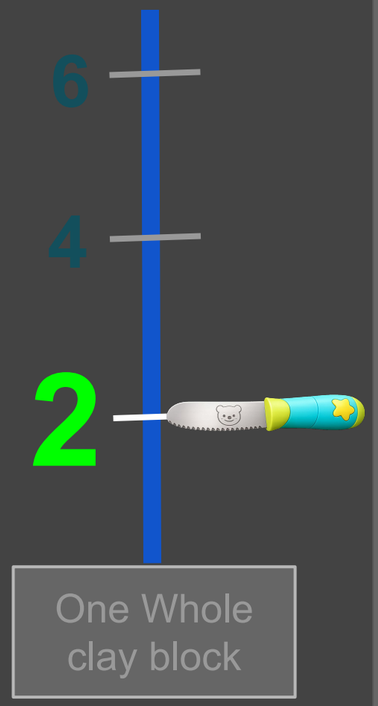


Divide the whole into 2 equal parts.

First pulsate 2 in the slider and then
Make an animation of cutting block into
two equal parts using knife (knife should
come from the slider), resulting slide
should look like below.



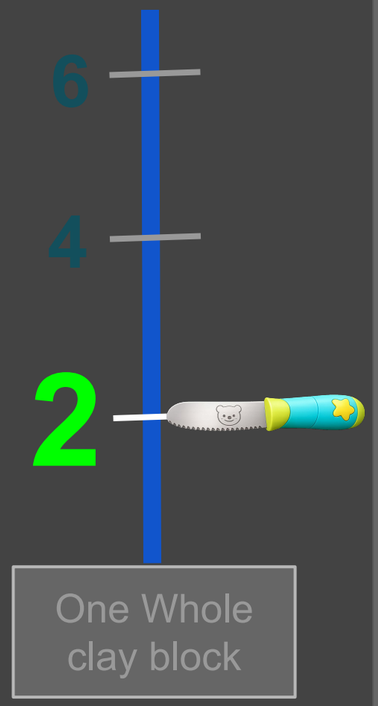
Divide the block
into equal parts



Select 1 out of 2 equal parts.

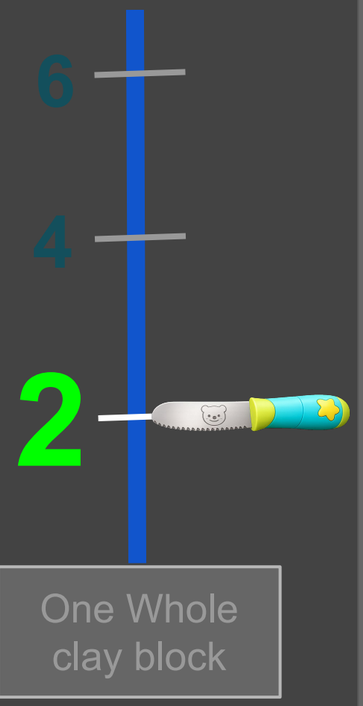
After one second of cutting, hand icon like below should appear.

Divide the block into equal parts



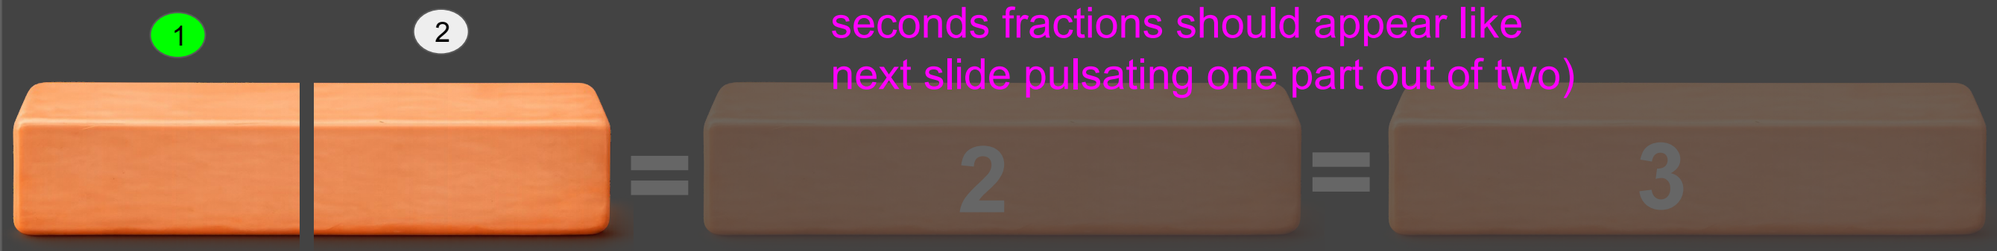
Select 1 out of 2 equal parts.

Divide the block into equal parts

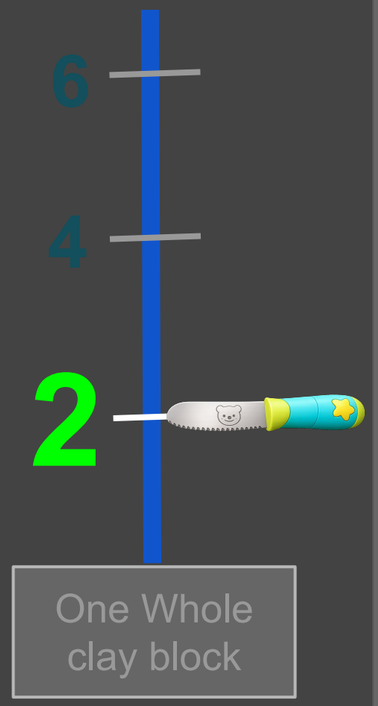


Select 1 out of 2 equal parts.

When the user select one parts Pulsate one part and it should look in such a way that selected part come front. After 2 seconds fractions should appear like next slide pulsating one part out of two)

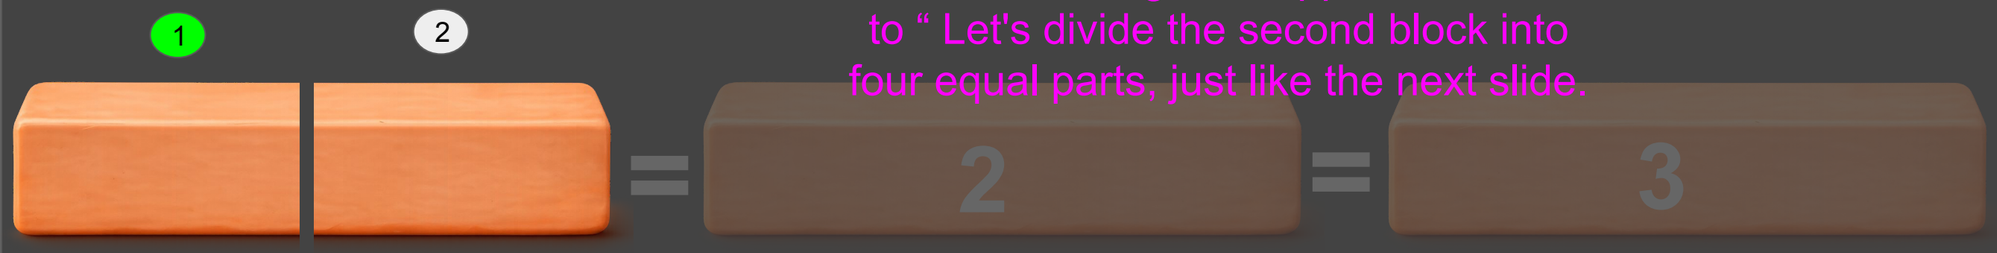


Divide the block into equal parts



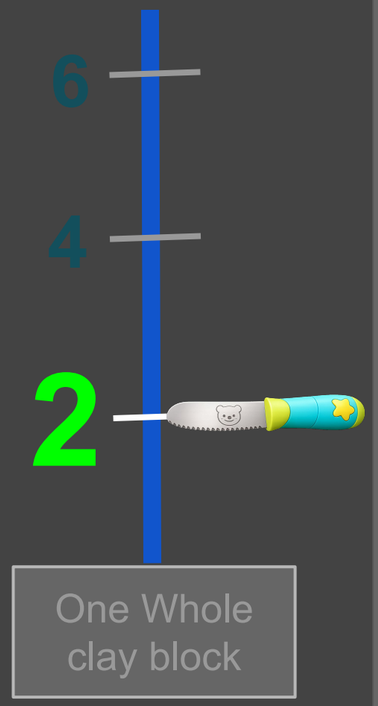
This is ½ of the whole.

After 2 seconds, dehighlight the first block and change the upper statement to “ Let's divide the second block into four equal parts, just like the next slide.

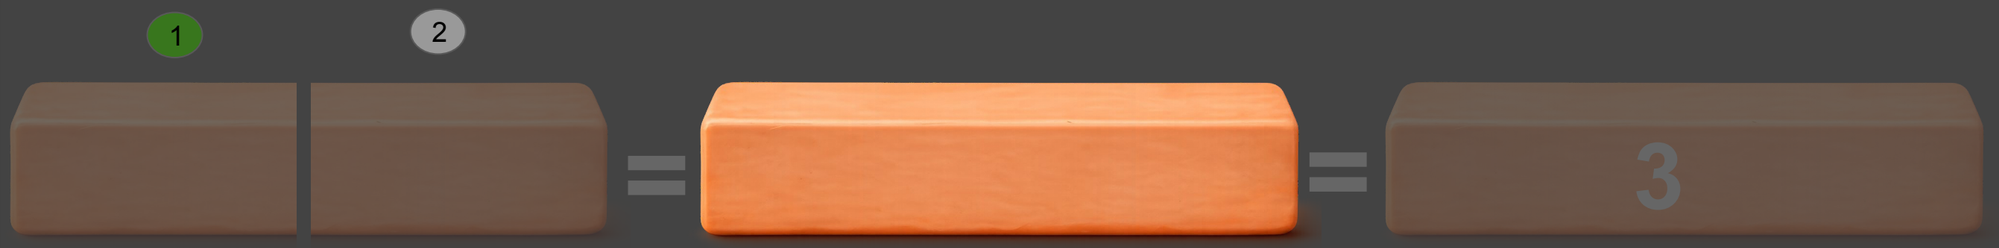


$$\frac{1}{2}$$

Divide the block into equal parts



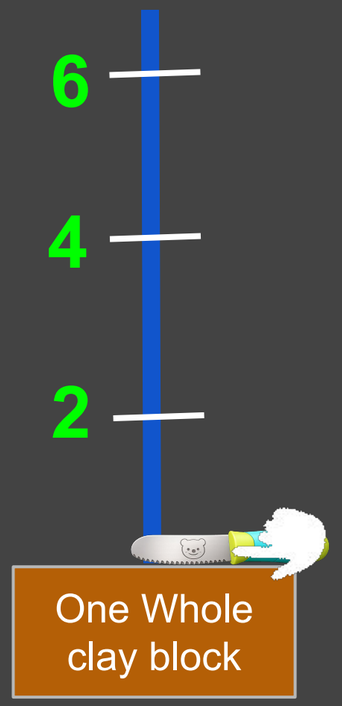
Now divide another whole into 4 equal parts.



$$\frac{1}{2}$$

If the user move the knife other than 3, block can be divided into that many parts and then teeter the block, move back the knife to original position, when place the knife in the correct number, just lock the knife at that number showing green highlight arround

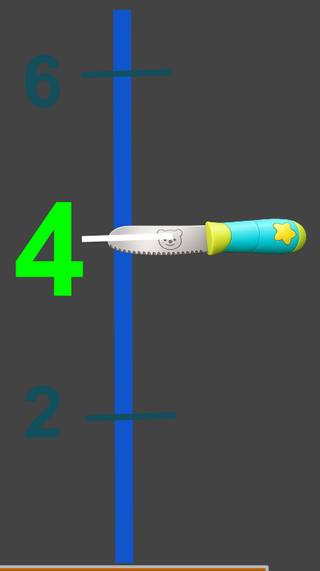
Divide the block into equal parts



Now divide another whole into 4 equal parts.

$\frac{1}{2}$ Follow the same flow and rule as dividing whole into two equal parts until the fraction appears.

Divide the block into equal parts

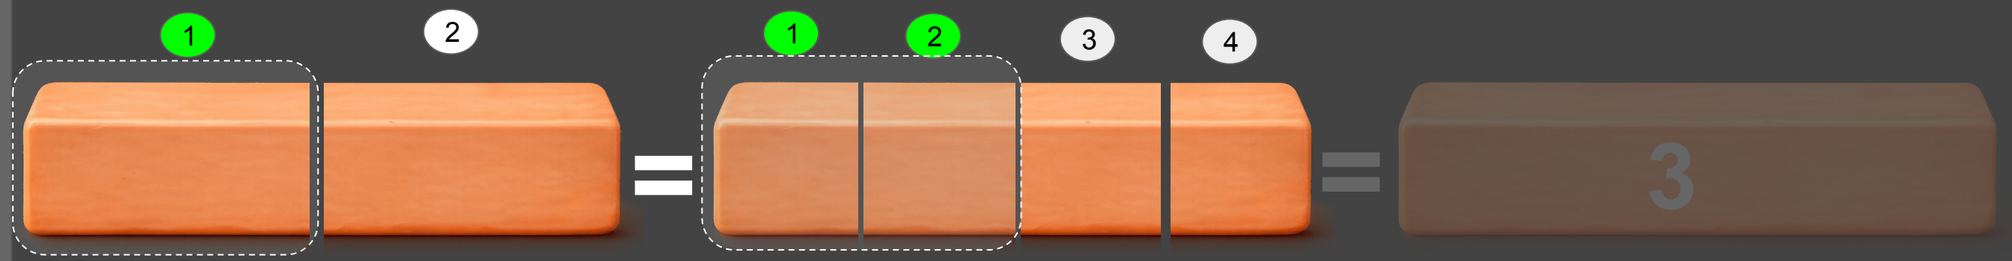


One Whole clay block

Follow the same rule as followed for the first block, the below slide should appear after showing the fraction of 2 out of 4.

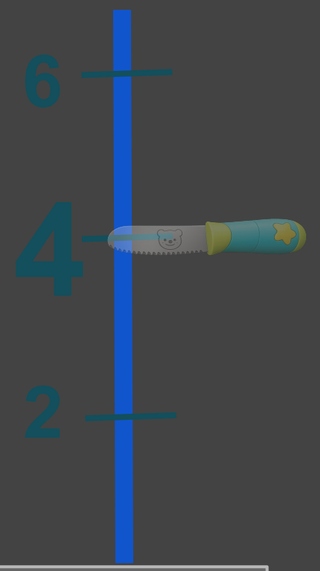
Both show the same value using different numbers of parts.

Pulsate both the highlighted parts and then equal sign.



$$\frac{1}{2} = \frac{2}{4}$$

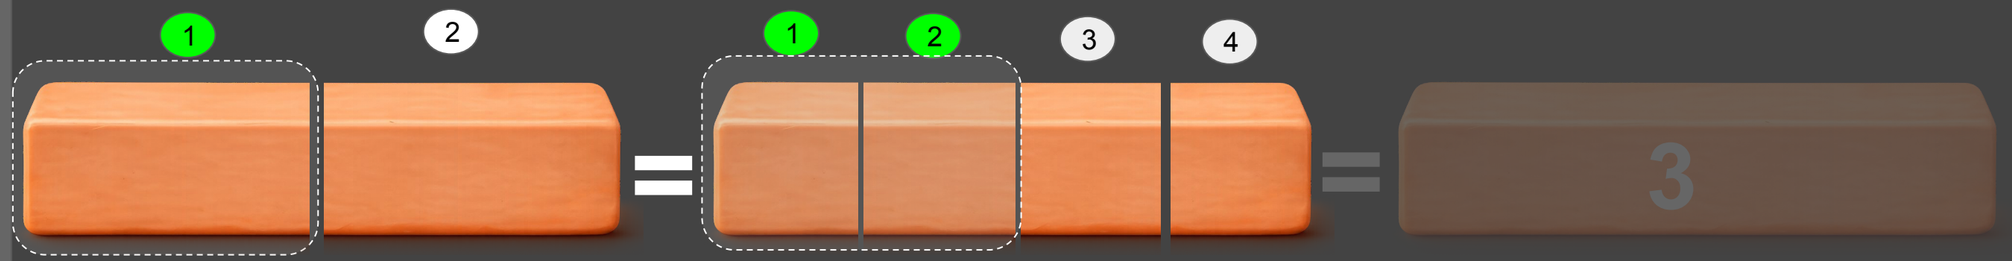
Divide the block into equal parts



One Whole clay block

Same value, different fractions — these are called equivalent fractions.

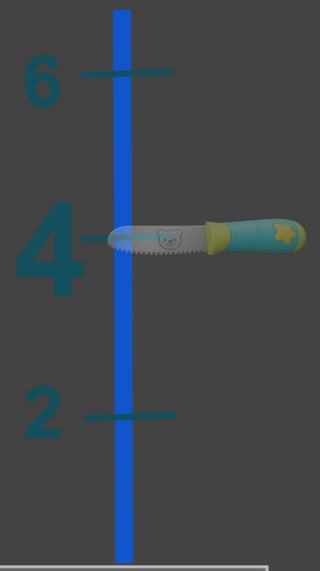
Pulsate both the highlighted parts and then equal sign.



$$\frac{1}{2} = \frac{2}{4}$$

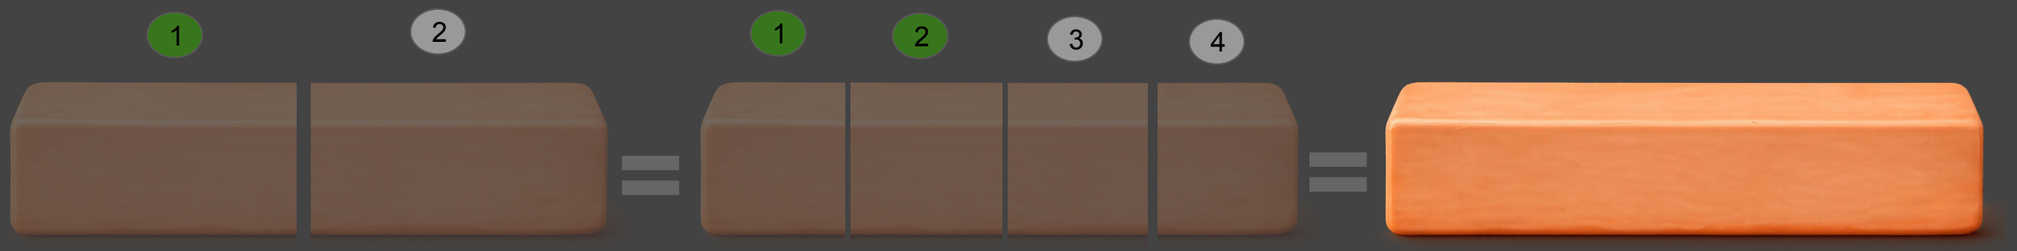
After 2 seconds, dehighlight the first and second block and change the upper statement to " Let's divide the third block into six equal parts, just like the next slide.

Divide the block into equal parts



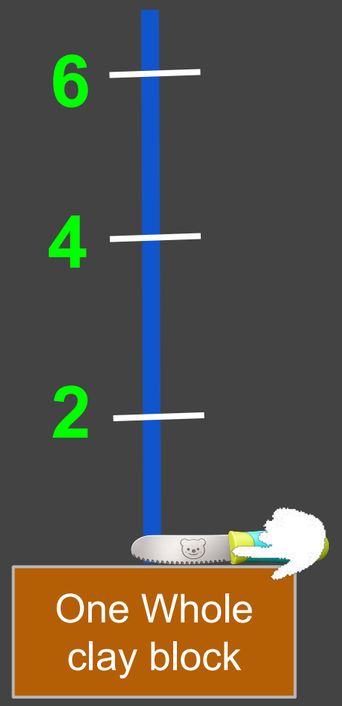
One Whole clay block

Now divide another whole into 6 equal parts.



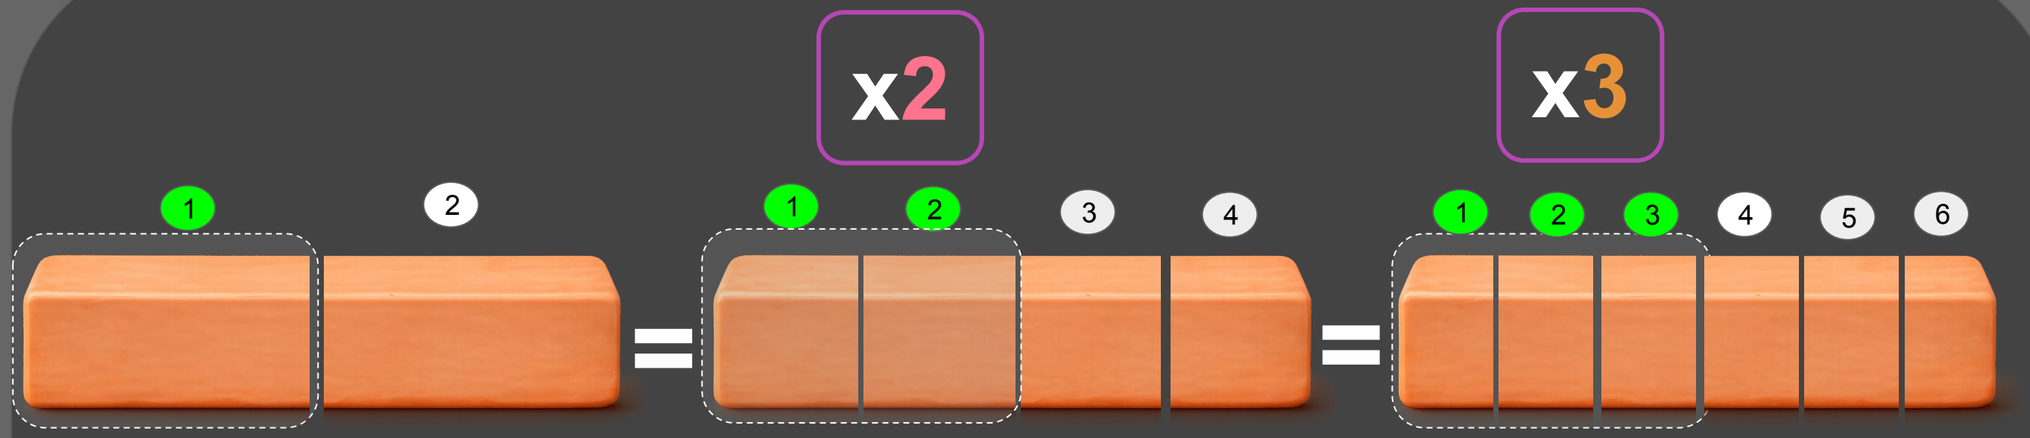
$$\frac{1}{2} = \frac{2}{4}$$

Divide the block into equal parts



Follow the same rule as followed for the first and second block.

Equivalent fractions are different fractions that have the same value.



$$\frac{1}{2} = \frac{2}{4} = \frac{3}{6}$$
